This gives us a point very near to-PB lot ithove It, ind at a very great distance to the right of YY Tnuswhen y paJSes through the value--3, x changes abruptly from--oo to oo. 54. From the above we see that  $y = (ax - b) / (cx + d)$ , where a, b, c, d stand for numbers, is the general type of such equations as that considered in the last paragraph, and that its graph will have two infinite branches with a pair of asymptotes parallel to the axes. Exercises. Draw the graphs of 10.  $y = x(x-2)$ . 11.  $y = (43)(x-6)$ . 12. Find the equations of the asymptotes of  $y = (ax + 6) / (cx + d)$ , and also the coordinates of the points in which it meets OX and OY. 55. Hyperbolas symmetrical with regard to both axes. Example. --Draw the graph of  $4x^2 - 9y^2 = 36$ . Write this in the forms  $y^2 = \frac{4x^2}{9} - 36$  (1) and  $x^2 = \frac{9y^2}{4} + 36$  (2) It will be seen from (1) that x cannot be numerically less than 3, but there is no limit to the extent to which it may increase in magnitude; in fact x may increase numerically from 3 to oo, and y from 0 to oo. We shall attack this by plotting a few points for small values of x and y, and shall then indicate the form of the curve at an infinite distance. We get the same values of y when x is --3, --4, . . . .
